KreditBee

PRODUCT TEARDOWN

KreditBee Personal Loan Product Teardown

Reducing customer effort across the borrowing journey

First-person product exploration & opportunity assessment

Source material: KreditBee public website, plus my own walkthrough of the Personal Loan application journey as a borrower.

Intent → Verify → Assess → Offer → Accept → Disburse

The journey a borrower should feel, with complexity handled behind the scenes.

PREPARED BY
Chetan Singh

DATE
9 October 2026

What I observed

I went through the journey as a borrower to see where friction sits and where a comprehensive journey can be simplified.

01 Process complexity is customer-facing

OBSERVED

Multiple customer-facing steps across permissions, KYC, offer, bank account and signing.

INFERENCE

Many of these could be orchestrated by the system rather than navigated by the borrower.

02 KYC reads as a list of separate tasks

OBSERVED

I was asked for a 14-digit CKYC number, then eKYC with consent, location, Aadhaar, a second consent, OTP, address, residence type and Video KYC.

INFERENCE

Valid requirements, but each surfaces as its own action.

03 Information is asked for twice

OBSERVED

Bank account typed with re-confirmation. AIR, APR, PF and net disbursal repeat across pricing screens. Credit report form asked me for details the app already held.

INFERENCE

Avoidable effort and error risk.

04 The journey loses continuity

OBSERVED

SMS permission sent me to device settings. On return I landed on the home screen showing every KreditBee product, away from my Personal Loan intent.

INFERENCE

Intent already declared; focus lost.

05 Communication can create more certainty

OBSERVED

Permission text is long, with the accept CTA below the fold and no scroll cue. Transfer and verification states say little about what happens next.

INFERENCE

Why, what next and how long are unanswered.

06 Verified data can work harder

OBSERVED

No Account Aggregator step appeared in my journey, and no email address was collected. Post-disbursal documents sit inside Profile.

INFERENCE

Reuse verified identity, bank and contact data.

The opportunity is not fewer controls.
It is fewer customer-facing actions.

KreditBee publicly positions the experience as 100% online with a quick disbursal. Every avoidable screen or handoff works against that promise, which makes journey efficiency the lever worth pulling.

The journey, end to end

Functionally comprehensive. Stage by stage, this is where the customer carries the load. Counts of screens are deliberately not stated.

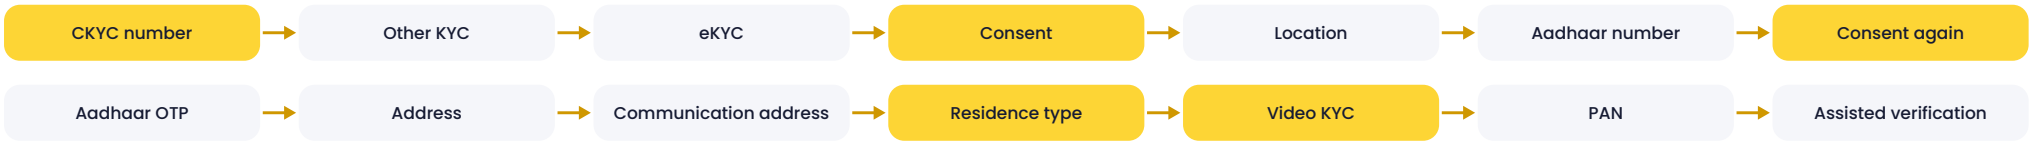

Yellow = KYC cluster, where the journey becomes customer-heavy (see page 4).

STAGE	CUSTOMER ACTION (OBSERVED)	PURPOSE (MY INFERENCE)	KEY FRICTION	OPPORTUNITY
Entry and permissions	Personal Loan, then mobile OTP. Grant SMS, installed apps, location and camera access.	*Identify user and device; risk signals*	Long text; accept CTA below the fold with no scroll cue. SMS grant redirects to device settings.	Two-line reasons, sticky CTA, in-flow permission where the OS allows.
Return and PAN	Land on home showing all products. PAN validated.	*Identity anchor*	Home competes with declared Personal Loan intent; continuity lost.	Resume at the next unfinished loan step. Prefill from PAN where consent allows.
Profile	General information. No email address requested.	*Underwriting inputs and contact*	Fields arrive before the decision that needs them. No email limits communication.	Collect per decision point. Capture email early.
KYC	CKYC number, eKYC (consent, location, Aadhaar, consent, OTP), address and communication address, residence type.	*Regulated identity and address verification*	CKYC number is jargon. Two consent moments. Residence type looks low-value for the customer.	KYC Orchestrator (page 4). Ask residence only if underwriting needs it.
Video KYC	Connect with an executive, show physical PAN, submit.	*Assisted identity assurance*	Waiting time and operational load on a high-intent customer.	Explore automated face and document match with human fallback. Validate with Risk.
Eligibility and lender	Approved amount shown. Amount and tenure auto-calculated. Lender cards with AIR, APR, PF, EMI.	*Decision and partner selection*	Limited explanation of why this amount, tenure or lender.	"Why this offer" and "Why this lender" in one line each.
Pricing and add-ons	Summary, then detailed charges. EMI protection and credit report pre-ticked. Loan purpose and document language asked.	*Disclosure and optional product attach*	Same values repeat. Optional products sit inside the core decision. Purpose is asked late.	One loan review screen (page 5). Ask purpose with the address step.
Bank account	IFSC, account number, re-confirmation. Option to add another account.	*Disbursal and EMI debit account*	Re-entry of data that can often be verified.	Confirm a verified account (page 5).
Agreement and auth	KFS and sanction letter, OTP signing, face authentication (Digitap), submit.	*Disclosure, acceptance, authentication*	Several authentication events back to back; limited next-step certainty on submit.	Keep KFS in full. Opportunity to validate whether OTP and face auth can consolidate.
Disbursal and after	Funds transferred. KFS, agreement, SOA and NOC found inside Profile.	*Servicing and trust*	Documents are hard to discover; repayment split not visible.	A dedicated "My Loan" section.

Where the journey becomes customer-heavy

The verification requirements may be valid. The opportunity lies in how many of them are surfaced as separate customer actions.

OBSERVED The KYC path I went through

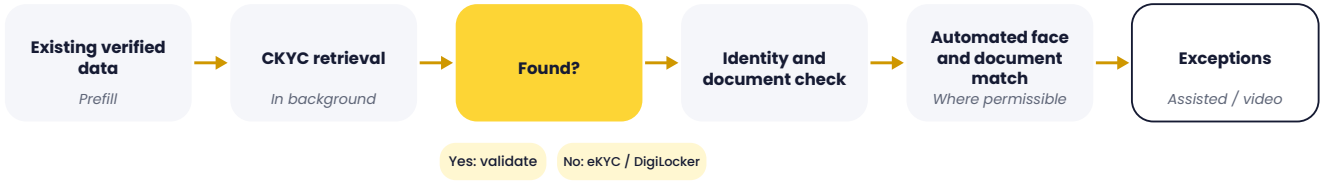

Yellow marks the moments where I felt the most effort or repetition.

CORE ISSUE

The underlying verification requirements may be valid; the opportunity lies in how many of them are surfaced as separate customer actions.

Let the system decide the verification route. Do not make the customer navigate it.

PROPOSAL **KYC Orchestrator, route chosen by the system**

Fallback is system-driven, not customer-discovered. If CKYC cannot be retrieved, the app can say: "We could not retrieve your existing KYC. We will verify your identity using another secure method."

Customer goal: "Verify me", not "complete eight KYC tasks".

PROPOSAL Opportunities to explore, each to be validated with Risk, Compliance and Engineering

Auto-fetch CKYC

PAN and mobile are already known. Asking for a 14-digit CKYC number is jargon the borrower should not need.

Consolidate consent

Consent is requested before eKYC and again after Aadhaar entry. Explore a single consent moment early, where legally and technically possible.

Prefill verified data

Reuse verified PAN and basic data and ask only for differences, such as a communication address.

Automate with human fallback

Explore compliant automated face-to-document matching, routing only low-confidence cases to assisted KYC.

Drop low-value questions

Residence type may be removable unless underwriting needs it. DigiLocker could be a fallback if Aadhaar eKYC is down.

BENCHMARK

Benchmark from another lending experience I have worked with: verified PAN and basic data is prefilled, and credit and bank checks run at progressive stages, so the system decides what the customer is asked for next. The point is not fewer screens, it is that decisioning drives the journey. KreditBee's lender architecture and regulatory requirements may differ.

Turn the final mile into a decision, not a data-entry exercise

Simplify the presentation of pricing while retaining complete mandatory disclosure, and let the customer confirm what is verified.

A LOAN OFFER AND PRICING

OBSERVED

1 Offer and lenders

Amount, tenure, then lender cards with AIR, APR, PF (ex GST) and effective EMI.

2 Summary and charges

Loan amount, total interest, AIR, APR, insurance premium deducted from EMI, net amount to bank.

3 Detailed charges

PF, credit report fee, loan document fee, GST. Pre-ticked EMI protection and credit report. Then loan purpose and document language.

INFERENCE

- Information repetition
- Multiple decision surfaces
- Optional products compete with the core decision

Disclosure stays intact. APR and all legally required pricing information remain visible, and the full KFS stays accessible. The change is information hierarchy, not information removal. Opt-in versus pre-ticked defaults for optional add-ons: validate with Compliance.

PROPOSAL **One transparent loan review screen** *Illustrative structure*

LOAN AMOUNT
₹XX,XXX

EMI
₹X,XXX / month
TENURE XX months

NET DISBURSAL
Amount you receive in your bank **₹XX,XXX**

Interest rate	XX% p.a.
APR	XX.XX%
Processing fee + GST	₹X,XXX
Other applicable charges	₹XXX

View complete pricing

Optional add-ons shown separately, below the decision

Continue

B BANK ACCOUNT

OBSERVED

IFSC code

Account number

Re-confirm account number

Optional: add another savings account

PROPOSAL **Where should we disburse your loan?**

HDFC Bank
•••• 4582 ✓ Verified

Use this account | Add another account

Illustrative. Depends on available verified data and compliance.

PRINCIPLE

If the system already knows something reliably, the customer should validate it, not type it again.

Also noted: no Account Aggregator step appeared in my journey. One primary account may be enough, as it is mainly used for EMI debit. Opportunity to validate.

Beyond the core loan funnel

Observed during my product exploration across language, support, Loan Against Property and the credit report surfaces.

A Language

OBSERVED

English and Hindi are available. A document-language choice is also asked late in the loan flow. I believe Hinglish is widely preferred in Indian fintech.

PROPOSAL

Explore 7–8 major Indian languages and Hinglish, contextual (not literal) translation, localized financial terms, and voice assistance for high-friction steps such as KYC.

English | Hindi | Hinglish | + major Indian languages

Language should extend beyond translation into comprehension.

B Support

OBSERVED

The support experience is rule-based with limited contextual intelligence. With Hindi selected, the chatbot and FAQs still showed English content.

PROPOSAL

Support that follows the application stage, intent, language and loan status, so the next problem is easier to resolve.

KYC stage → KYC help

Bank step → Bank help

Disbursal → Payout help

Language follows the user's choice

Reduce the effort required to resolve the next problem.

C Loan Against Property

OBSERVED

I entered PIN code, owner and property details, property value, and only then learned the location is not serviceable.

PROPOSAL

Run the serviceability check on the PIN code first and communicate the result immediately. Collect deeper property information only after that.

PIN code → Serviceability check → Serviceable → Property details

Not serviceable: tell them now

Do not make customers invest effort before discovering the product is not available to them.

D Digital Gold and credit report

OBSERVED

A Digital Gold banner continued to show although the product was not available to me. The credit report asked me to fill details the app already held, before payment.

PROPOSAL

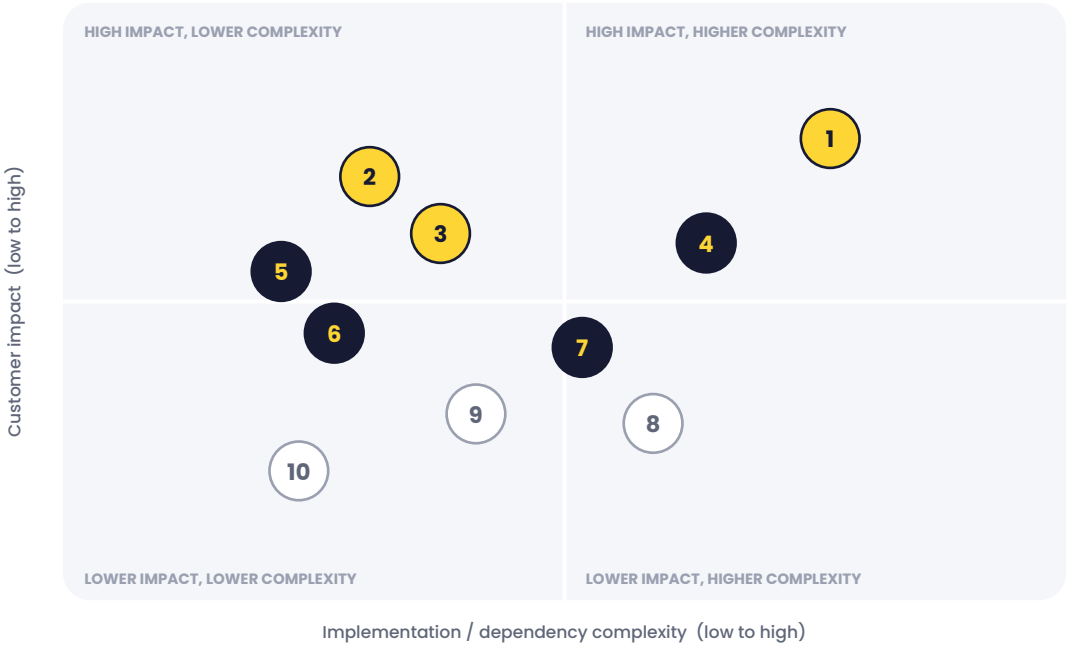

Prefill known information. Explain the report in 30–60 seconds before payment, listing what it contains. Explore personalised score-improvement guidance using compliant bureau capabilities (hypothesis: a CRIF predictive API could support this).

Prefill known data → Explain the report → Pay → Credit-health insights

Turn a one-off transaction into credit-health engagement.

Where I would start

Customer impact against implementation and dependency complexity. Placement is my judgement, to be validated with Engineering and Risk.

1	KYC orchestration	P0
2	Journey continuity	P0
3	Offer and pricing consolidation	P0
4	Verified data reuse	P1
5	Application-state communication	P1
6	Earlier serviceability checks	P1
7	Context-aware multilingual support	P1
8	Credit-health engagement	P2
9	Post-disbursal "My Loan" hub	P2
10	Other experience enhancements	P2

FUTURE-STATE JOURNEY

Yellow marks where the customer sees the biggest change.

Fewer meaningful milestones, not simply fewer screens.

The customer sees a short run of meaningful milestones while the backend can still perform every check, including KYC, bureau, banking and fraud, behind the scenes.

How I would measure success

Exact uplift cannot be claimed without KreditBee's internal funnel data, so impact is measured through stage-level conversion.

NORTH STAR

Application to Disbursement Conversion

WHY GUARDRAILS MATTER

Because this is lending, conversion cannot be optimised independently of credit quality and fraud.

Every experiment would ship with its guardrail metrics, and a gain at one stage only counts if quality holds.

FUNNEL

- Mobile verification
- Permission completion
- KYC completion
- Profile completion
- Underwriting completion
- Offer acceptance
- Bank verification
- KFS acceptance
- Final authentication
- Disbursement success

EFFICIENCY

- Median time to complete
- Customer actions per application
- Screens / milestones
- External handoffs
- Assisted KYC rate

CUSTOMER EXPERIENCE

- Step-level drop-off
- Error rate and back navigation
- Support contacts in-flow
- Language-related contacts
- CSAT / NPS

QUALITY GUARDRAILS

- Fraud rate
- Verification failure
- Credit quality
- Early delinquency
- Complaint rate

BUSINESS

- Application to sanction
- Sanction to disbursal
- Cost per completed application
- Operational KYC cost

INFERENCE

The compounding funnel effect

Illustrative model, not KreditBee internal data

Overall completion = stage 1 × stage 2 × … × stage 8

8 stages at 90% each — **43%**

8 stages at 93% each — **56%**

Small improvements at multiple stages can compound into a material change in completed applications.

0.90 to the power of 8 is about **43%**. 0.93 to the power of 8 is about **56%**. A 3 percentage-point gain at each stage is roughly a **30% relative** increase in completed applications.

The product opportunity I see is not to remove the complexity of lending. It is to hide more of that complexity behind intelligent orchestration, allowing the customer to experience a journey that feels simple, trustworthy and fast.

That is where I would start.
